Copyright – DELTA ELECTRONICS, INC. - All rights reserved.

This manual accompanies our product for use by the end users. The technical instructions and illustrations contained in this manual are to be treated as confidential and no part may be reproduced without the prior written permission of DELTA ELECTRONICS, INC. Service engineers and end users may not divulge the information contained herein or use this manual for purpose other than those strictly connected with correct use of the product. All information and specifications are subject to change without notice.

DELTA ELECTRONICS, INC. shall have no obligation to either personal injury and property damage claims hereinafter with respect to any actions -- (a) the product has been installed and/or repaired improperly; (b) the product has been misused without following the instructions on this user manual; (c) the product has failed due to incorrect unpacking.

1.1.2 Target Group

This manual is prepared for use by well-trained technician for installing, commissioning, operation, and maintenance. The technician must have the following basic and advanced skills:

- Knowledge of the fundamentals of electricity, wiring, electrical components and electrical schematic symbols.
- Knowledge of how a solar inverter works and is operated.
- Training in the installation and commissioning of electrical devices and installations.
- Training in how to deal with the dangers and risks associated with installing and using electrical devices and installations.
- Compliance with this manual and all safety information.

1.2 General Safety

IMPORTANT SAFETY INSTRUCTIONS : SAVE THESE INSTRUCTIONS !

- Please read these instructions carefully and save them for later use.

To prevent personal injury and/or property damage, and also to ensure long term operation of the solar inverter, it is imperative this section be read carefully and all the safety instructions understood before using this inverter.

This user manual provides important instructions for Delta grid-tie transformerless solar inverter. The product is designed, tested, verified, and certified according to international safety requirements, certifications, and standards but precautions must be observed when installing and operating the product.

This product is suitable for both indoor and outdoor use.

ATTENTION : NO GALVANIC ISOLATION

- 
- The design of this inverter is transformerless. There is no isolation transformer between the AC and DC sides, i.e., the product does not require galvanic isolation. In order to function properly, any PV array connected must have its PV circuits isolated from ground, i.e., do not bond either side of the array to ground! If a grounded PV array is connected to the inverter, the error message INSULATION (E34) will appear on the display.
 - It is prohibited to reference the L1, L2, L3 or N terminal to ground; to do so will damage the inverter and void the producer warranty.

1.2.1 Condition of Use

- M100_210 is a transformerless solar inverter with 1 MPP tracking input, which converts the variable direct current generated by the solar array into a utility frequency grid-compliant balanced three-phase AC current and feeds it into the utility grid.
- The Photovoltaic modules used must be compatible with the inverter. PV modules with a high parasitic capacitance to ground may only be utilized if the capacitive coupling does not exceed 10 μ F.
- The inverter should be operated in countries which are approved by DELTA and the grid operator.

1. Keep 10-20 cm length of straight cables from the edge of cable glands.
2. Anchor or support the straight cables to strain relief.
3. Must be routed to create a “hump” to prevent flowing water on the cable gland.

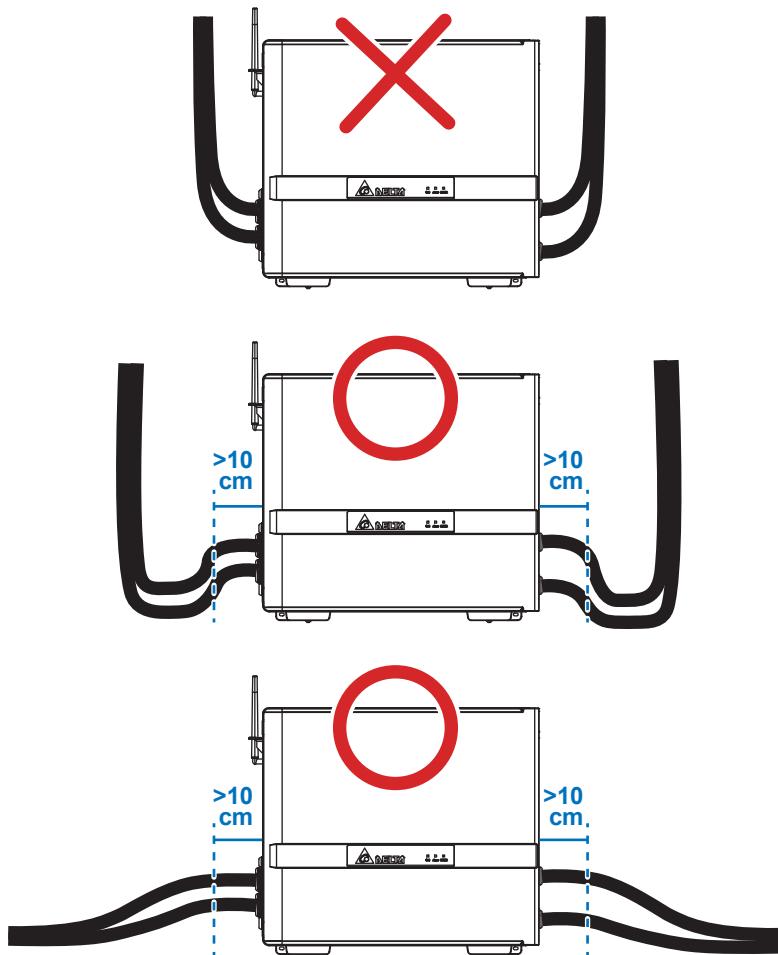

Figure 3-11: Cable routing

Please do not separate the three phase AC cable into individual metal conduit to avoid eddy current affect, please refer **Figure 3-12** for AC cable installation suggestion.

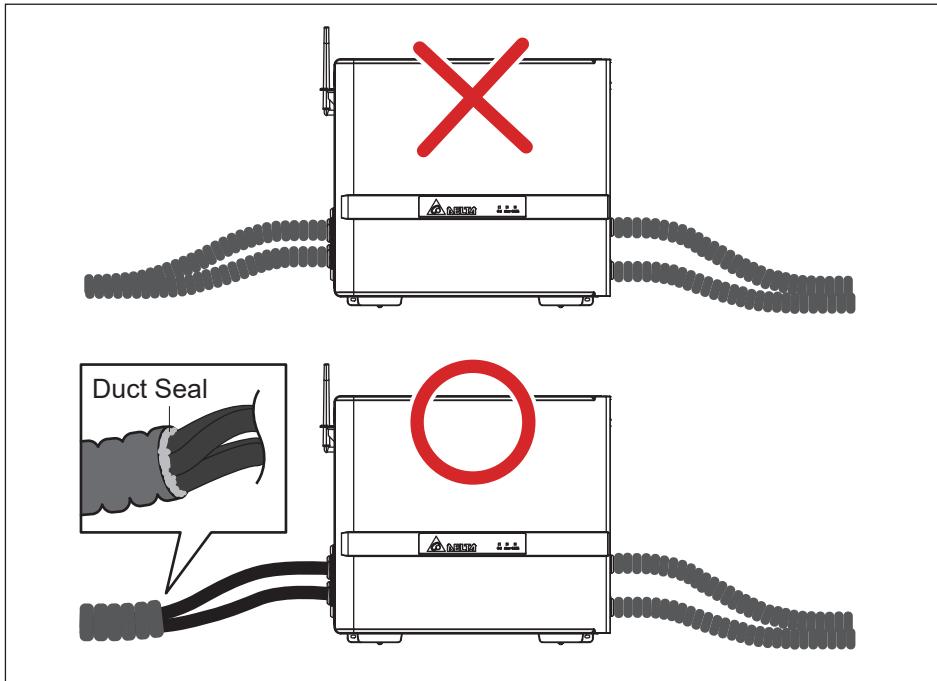

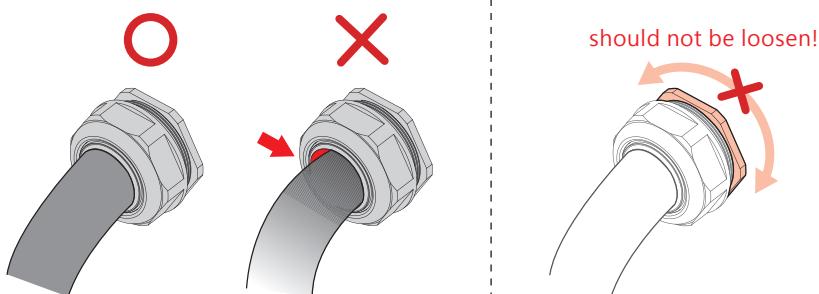

Figure 3-12: AC side metal conduit installation suggestion

CAUTION !

- Please make sure there is no gap between gland and cable.
- Please make sure the gland is tight after setup as shown below.

3.4 Electrical Installation for AC Wiring

DANGER : ELECTRICAL HAZARD!!

- To avoid shock hazard during cabling, insure any live grid connections are removed from the inverter.

WARNING !

- Code compliance is the installer's responsibility.
- Inverter warranty void if the DC input voltage exceeds 1100 Vdc.

CAUTION : INVERTER AND EQUIPMENT DAMAGE MAY OCCUR !

- Installation for AC terminal must meet the local electrical code.
- Failed to follow the instructions may damage AC cable.

CAUTION: WRONG AC WIRING !

- In order not to damage the components in the inverter, ensure the correct conductor is connected to the appropriate AC terminal on the inverter.

Please follow the instruction of **Section 5.1** to open or close M100_210 door.

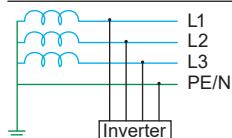

3.4.1 AC Grid Types and Connections

The communication module of M100_210 is shown in **Figure 3-23**. It provides VCC, RS-485, dry contact, EPO, and Digital Input terminals for use in various applications. Details for each are presented below.

There's a 12VDC source between VCC & GND for use with external device.

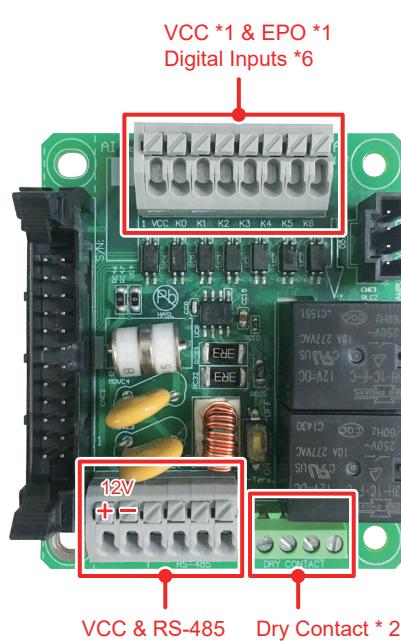

Figure 3-23: Communication Module Layout

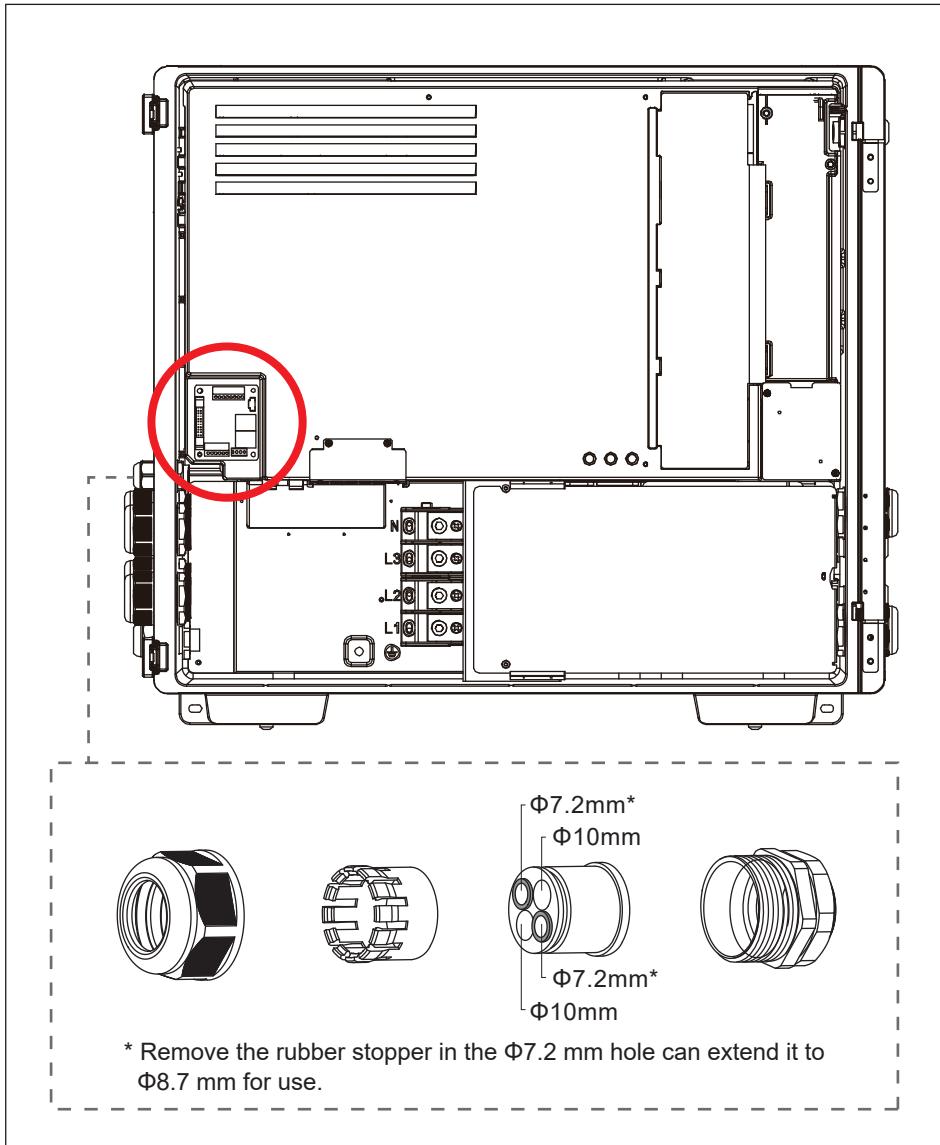

Figure 3-24: Location and access to Communication Module

3.7.1 RS-485 Connection

The pin definition for the RS-485 terminal block is shown in **Table 3-3**.

- Pins 1 and 2 provide a 12VDC / 0.5A bus for use with accessories.
- Pins 3 and 5 are both connected to the DATA+ input.
- Pins 4 and 6 are both connected to the DATA- input.

These connections allow easy daisy-chaining of multiple inverters.

A 120ohm bus termination resistor and associated control switch are located on the communication board (**Table 3-4**).

Different RS-485 connection scenarios require different set up for the 120ohm bus termination resistor.

- When several inverters are cascaded (i.e., "daisy-chained") only the last inverter in the chain must have its bus termination resistor switched ON (**Figure 3-25**).
- If the length of any RS-485 bus is greater than 610m, the use of Belden 3105A cable (or eq.) is recommended to insure communication quality.

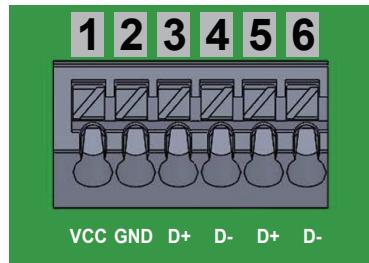

ATTENTION

- In order to have good transfer quality, twisted-pair wire is recommended to be used as communication cable.

INFORMATION

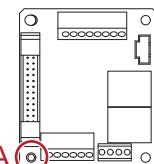

When the RS-485 cable needs to be grounded, please follow the steps below.

1. strip a wire from the shielding layer and properly insulate it
2. crimp the insulated wire to the Y-type lug and fix it in position A

3.7.2 EPO Function & Digital Input

The communication Module has an emergency power off function (EPO). Users can customize EPO function in APP or Delta Solar System (DSS).

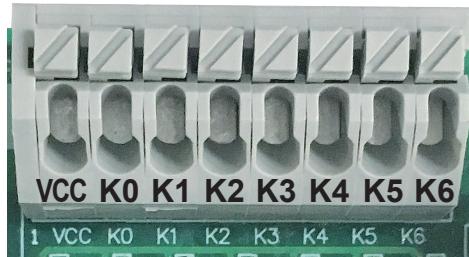

Figure 3-26: EPO function terminal block

Once enabled, the EPO function can be used to turn off the inverter via a NO relay contact connected across terminal [VCC & K0].

Additionally, a digital power reduction control is available that can be set to limit the inverter's available active output power. The control settings for this function are made by placing a hardware short (jumper or relay) between two terminals of the terminal block shown in **Table 3-5**, below.

Table 3-5: Definition of digital input & EPO function

Short terminals	Inverter's action

3.7.3 Dry Contact Connection

M100_210 provides a dry control contact pair that may be used to control external devices based on the status of operation of the inverter.

The terminal block for this function is shown in **Figure 3-27**. The terminals marked in the figure identify the dry contact connection. The operation of the dry contact is normally open. The functionality of this contact can be customized by users via settings available in APP or DSS.

5 Maintenance

Regularly maintenance can ensure that the inverter can keep great performance. DELTA recommends to have a check to the unit every year at least. The frequency of maintenance should be adjustable depends on the environment of the site, different seasons and weather impacts.

DANGER : ELECTRICAL HAZARD!!

- Ensure DC and AC cables are always de-energized during the maintenance to avoid the shock hazard risk!

5.1 Open and Close the Door

5.1.1 Disconnect M100_210 from Voltage Sources

1. Disconnect the AC Circuit breaker and secure to against reconnection.
2. Disconnect the DC switch which is in the PV combiner box or on DC Bus, then secure to against reconnection.
3. Wait 60 seconds and make sure LED indicators of the inverter have gone out.
4. To ensure there is no current in the cables, please use a current clamp to measure DC/AC cables.

5.1.2 Open Door

ATTENTION

- Before opening the front door, please wipe the inverter case if it is wet to avoid water seepage.

1. Remove screws of the antenna bracket.
2. Use the 4mm hexagon wrench to loose the screw of the protection cover, and then release the latch locks.
3. Open the inverter door and use the hexagon wrench to fix the door.
4. The inverter door can be removed for wider working space during installation or maintenance.

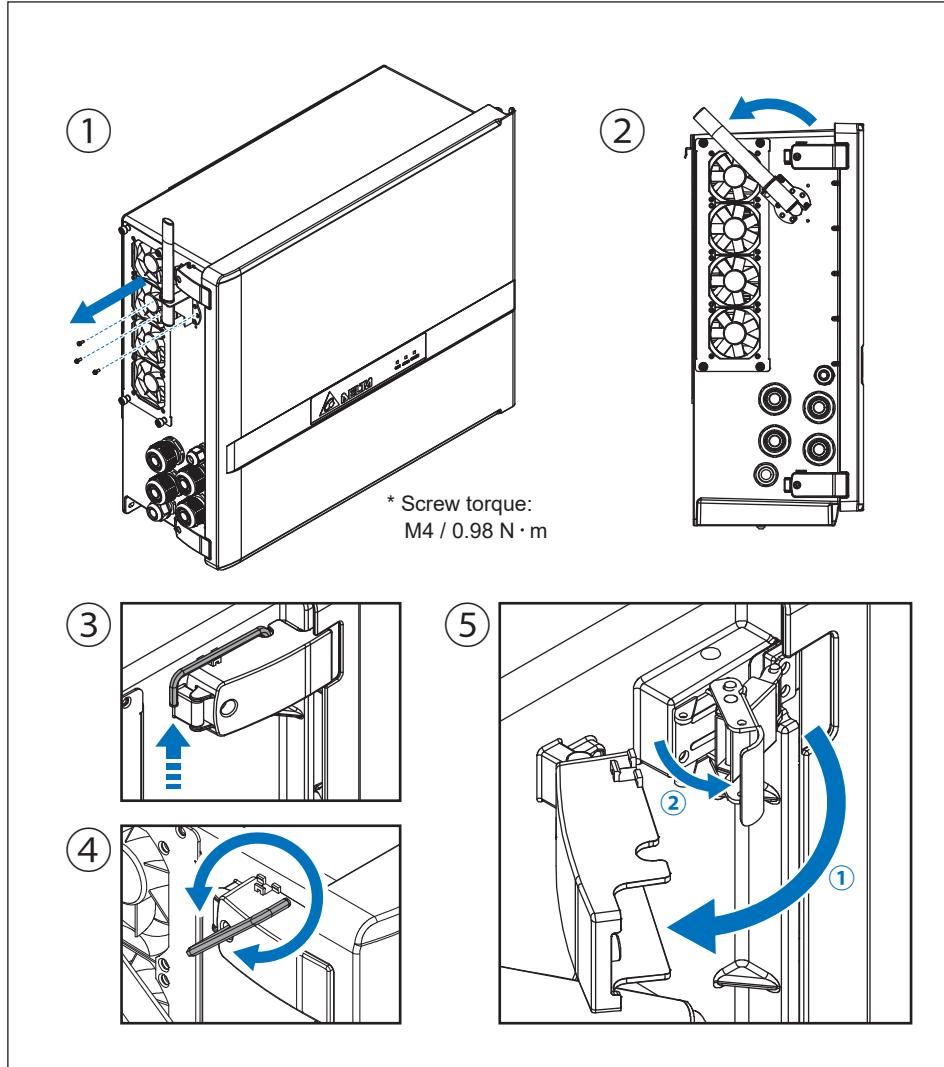

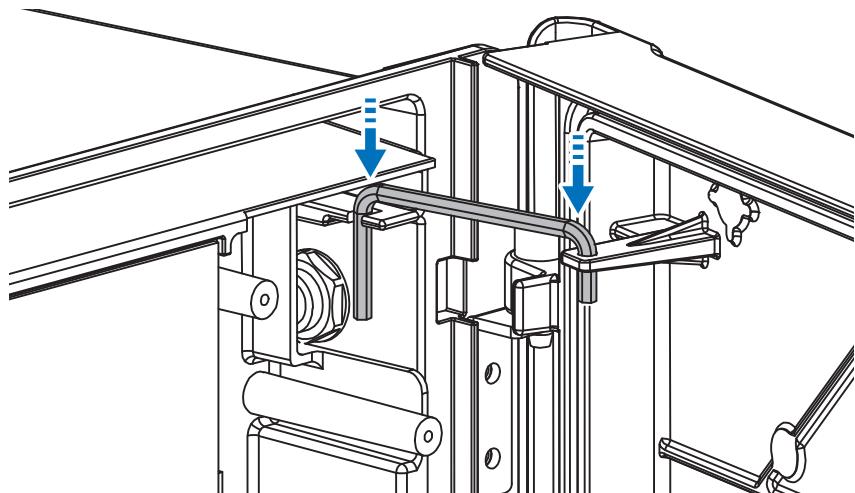

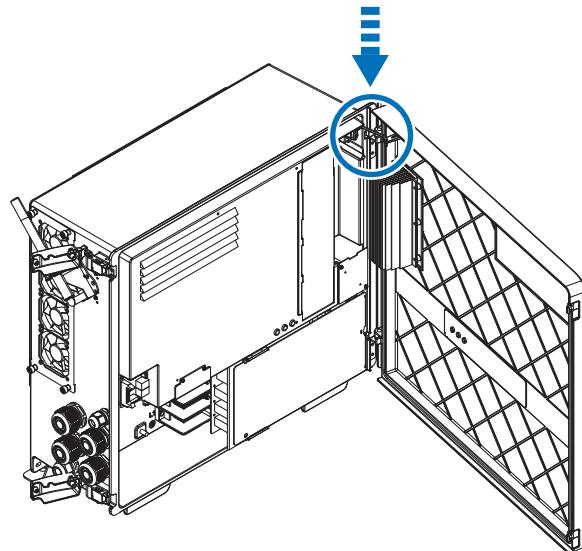

Figure 5-1: Opening and closing the door

ATTENTION

- After opening the door, please make sure the door is fixed by hexagon driver to avoid strong wind breaking it.

Figure 5-2: To secure door by hexagon driver

If the installation space is too narrow for wiring or maintenance, the front door can be removed as shown below.

After the operation is done, please install the door onto the inverter and follow the procedures in **Section 5.1.3** to close the door.

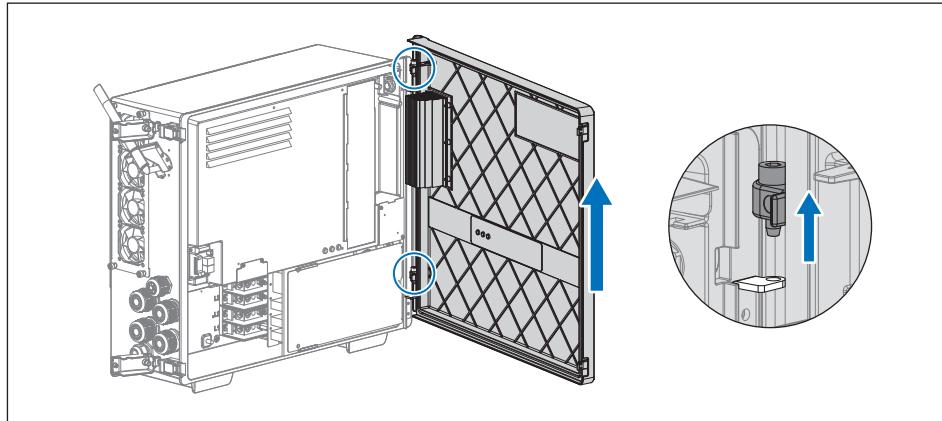

Figure 5-3: Remove the door

5.1.3 Close Door

ATTENTION

- Excessive moisture or dust in the inverter could cause unexpected damage due to the corrosion on the live part. Ensure the inner of the inverter clean without unreasonable pollution is important for a lifetime operation system.
- After cabling or maintenance for the inverter, please lock both toggle latch to make sure the inverter will remain IP66 protection.

1. Make sure that the terminals or viewable live parts are clean without sundries, dust even liquid.
2. All protection covers are installed well.
3. Remove the hexagon wrench and close the door.
4. Buckle the latch locks and fix its protection cover by the hexagon wrench with 2 N·m torque.
5. Fix the antenna with its bracket by 0.98 N·m torque.
6. The hexagon wrench can be fixed on the protection cover.

5.2 Replacement of Surge Protection Devices (SPD)

M100_210 has Surge Protection Device (SPD) for AC and DC wirings, which is behind the protective cover and can be replaced in damaged.

- Power Module (PM) compartment
- Inside the inverter compartment

Figures 5-8 illustrates the PM fan location.

Figures 5-9, 5-10, 5-11 illustrates the internal fan 1 locations.

Figures 5-12, 5-13, 5-14 illustrates the internal fan 2 locations.

ATTENTION

Periodic fan and filter cleaning is required to insure long life and reliability.

- The time period between cleanings depends on the quality of the environment.
- Under normal duty use, Delta recommends smart fans and filters be cleaned every 4 months
- For very dusty locations, it may be necessary to clean the fans and filters quarterly or monthly.

The cooling fans feature modular designs that make their removal for cleaning or replacement a simple task. As a result, the replacement of fans is also smart.

DANGER : ELECTRICAL HAZARD!!

- Prior to beginning any maintenance procedures outside AC breaker and DC switch off to avoid risk of electrical shock!

5.3.1 Location of failure fan

If the Error-code comes "W11 - Fan Fail", please refer to the corresponding code shown on DSS and procedure in following chapters to remove the fan.

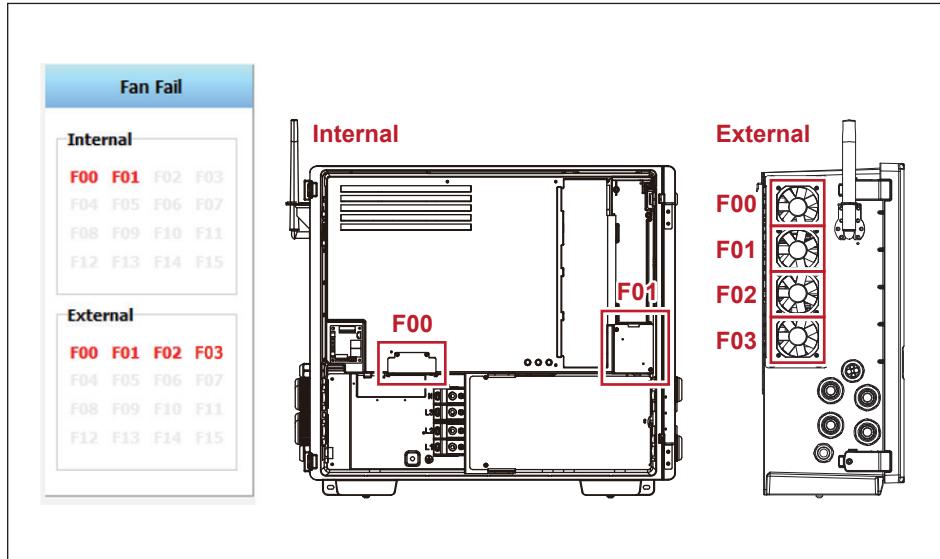

Figure 5-7: The corresponding fan location to the fan fail code on DSS

5.3.2 Power Module (PM) Fan Tray

Refer to **Figure 5-8** and follow the steps outlined below:

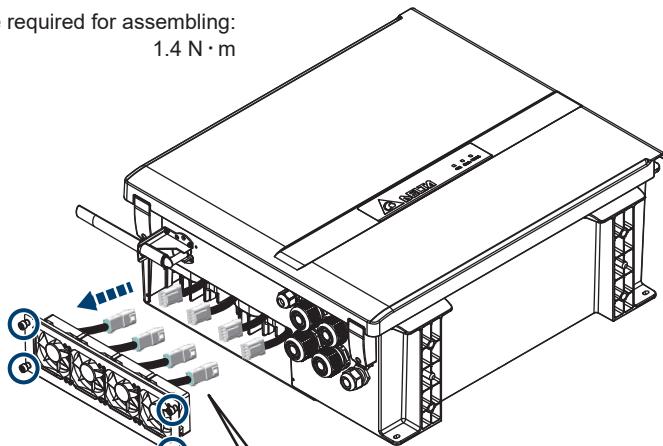

1. Remove four screws that secure inlet filter cover to case.
Check filter condition on this step and clean it if necessary.
For fan maintenance, continue to do following steps.
2. Unplug fan power connectors for each fan.
(To release snap-fit, press location A and location B from both side .)
4. Pull fan tray out from PM chassis.

通信模組如圖3-23所示。

該模組提供一組12V電壓源VCC、RS-485、乾接點、EPO和數位輸入端子供功率控制使用；詳細說明如下。

使用VCC 與GND輸出腳位，可提供一12VDC電源，可供外部裝置使用。

圖 3-23 : 通信模組

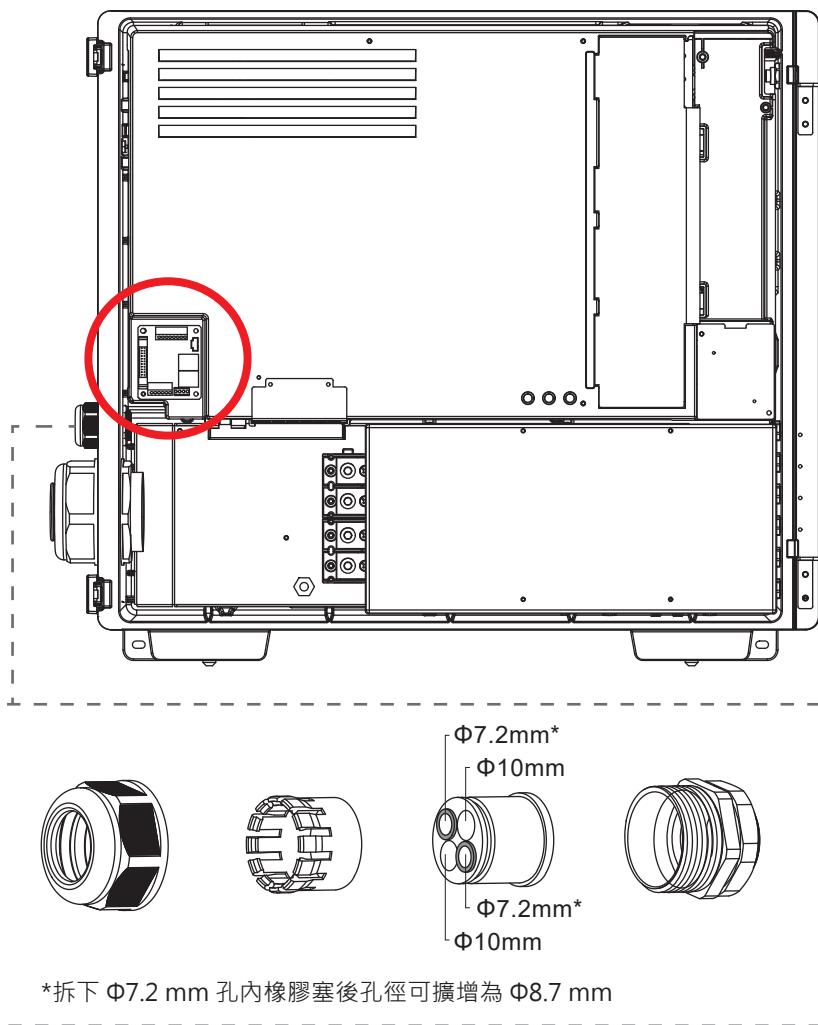

圖3-24：通信模組位置圖

3.7.1 RS-485 連線

RS-485端子座腳位定義如表3-3所示

-腳位1與2提供直流電壓12V/0.5A電源

-腳位3與5為RS-485差動信號之DATA+信號專用腳位

-腳位4與6為RS-485差動信號之DATA-信號專用腳位

依據上述的腳位，可以實現多台變流器的通信連接。

本機器設有120歐姆終端電阻，可使用通信模組上的控制開關進行切換(表3-3)。

不同的RS-485連接方式時，需使用不同的終端電阻設定方式。

- 當多台變流器連接時，只有最後一台變流器必須將終端電阻接通如圖3-25。

- 如果RS-485總線長度大於610m，建議使用Belden 3105A電纜或同規品來確保通信品質。

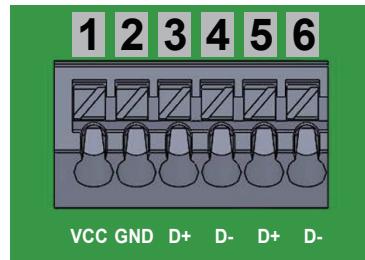

注意

- 為確保良好的通信品質，建議使用絞線之電纜方式配置。

資訊

當RS-485需要接地時，請遵循以下步驟

- 從隔離層剝出一條接地線(線徑: 0.5~1.5 mm²)，並做適當絕緣防護
- 將接地線壓接Y端子(建議型號: SNYBL1-4)，並鎖附於下圖 A 處
